

EduSync

Making a student dashboard easier to understand and try.

Yash Zaveri | Independent personal project | April - September 2026

THE STUDENT PROBLEM

EduSync began with my own frustration: course files, deadlines, announcements, and grades were spread across different views. The product idea was to make the next useful action easier to find. This is a personal observation, not a user-research finding.

THE INTENDED AUDIENCE

Students balancing several courses and commitments, initially in a Brightspace/Microsoft university environment. The public experience also lets a recruiter evaluate the idea without a university account.

BEFORE / APRIL INTERFACE

Archived April code rendered September 23; viewport excerpt. Historical privacy wording shown, not endorsed.

AFTER / SEPTEMBER LANDING PAGE

Actual live screenshot, September 23. The preview contains fictional student information.

From feature inventory to a student benefit

MESSAGE	BEFORE	AFTER
Promise	"Your university command center"	"Less catching up. More moving forward."
First action	"Sign in with Microsoft"	"Explore the demo" + "No account needed for the demo."
Trust	"Never shared with third parties"	FAQ discloses database storage and Anthropic processing for the signed-in app; demo uses fictional data.

01 Show value before asking for access

Make "Explore the demo" the primary action, with connection secondary. Visitors can try fictional tasks and grades before considering account access. The reasoning: show the product's value before asking for trust. Any effect on conversion remains untested.

Turning the promise into choices

Live demo: one next action and visible progress.

Live demo: sample scenario, formula and assumptions.

02 Give the day a starting point

Use a sage "Your next move" card, three summary counts, and separate navigation for detail. This gives the daily view a clear starting point. Completing a sample task advances the focus card and updates progress; reduced planning effort is a hypothesis, not a measured result.

03 Make uncertainty visible

Place the final-score slider beside the projected grade, formula, and assumptions. Label it "A scenario, not a prediction." This makes the calculation easier to inspect and keeps an illustrative estimate from looking like an official university grade.

Explore the fictional-data demo - no account required

Checked September 23, 2026: the demo loads without credentials, skips account lookup, and reads hard-coded fictional fixtures. Its controls use browser memory and contain no student-data or AI requests. Observed resources were static files only; signed-out course, grade, task, and announcement requests returned HTTP 401. The deployed demo bundle matched the reviewed build.

The demo shares the production domain; it is not a separate security sandbox. These checks establish the reviewed demo's behavior and signed-out access boundary, not a guarantee against every security flaw. Leaving the demo for student sign-in enters the separate authenticated flow.

MY ROLE & AI ASSISTANCE

I defined the problem and project direction, reviewed iterations, and used Claude and Codex extensively for implementation, debugging, interface copy, and verification. The assistants generated substantial code; this is an AI-assisted product and messaging project.

PROJECT LIMITATIONS

Live Brightspace access depends on expiring session cookies. Reliable current-semester importing and AI briefings remain unverified. Demo suggestions are scripted, task changes reset on reload, and grade scenarios simplify course rules. EduSync is independent and is not university-endorsed.

What this demonstrates: a shipped landing page and working fictional-data demo. No formal user research, adoption, engagement, or time-saved results are claimed.
